

SECUREDESK-Mail (Encryption) - Policy based Encryption Service

SECUREDESK-Mail (Encryption) - Email is vital in business communication. Companies are dependent on email to communicate with customers and employees on a daily basis. This communication often contains sensitive information - intellectual property, financial figures, medical records, or other data - that is subject to regulatory compliance requirements.

Why encrypt?

Over the next year or so we will start seeing new legislation requiring email encryption, but even now:

- The UK Data Protection Act insists that companies protect personal data, use it only for its intended purpose, keep it accurate and comply with several other data protection principles. Violators are subject to prosecution.

What is SECUREDESK-Mail (Encryption)?

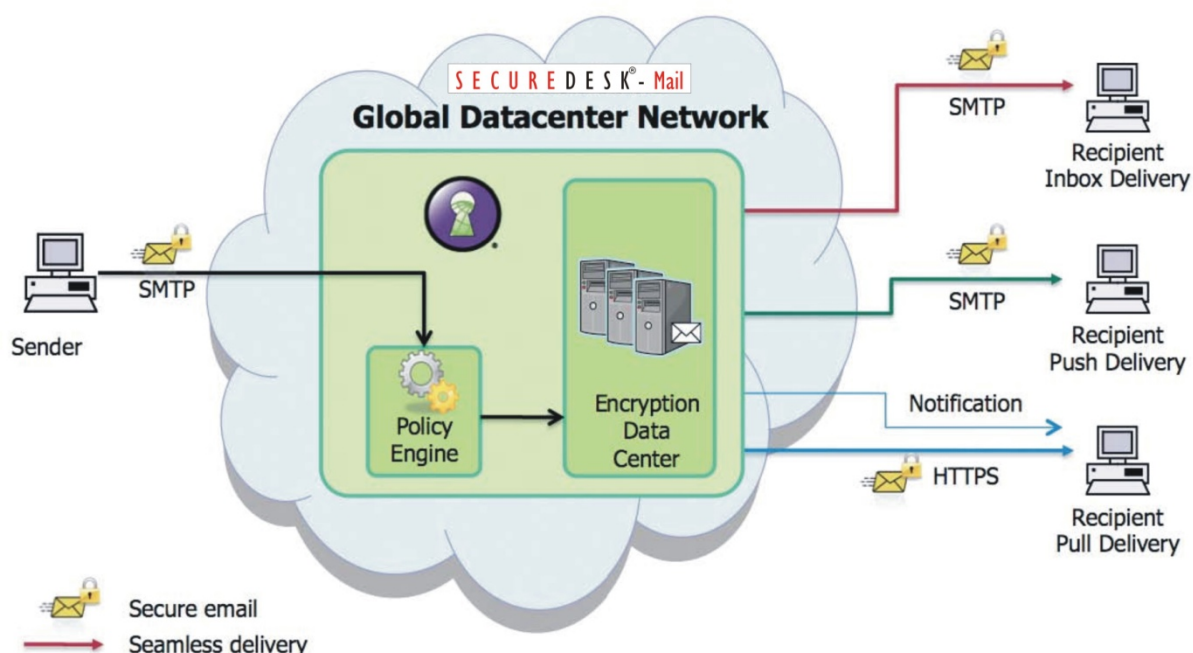

Email Encryption is no longer a luxury – it is a critical part of a comprehensive security strategy.

The **SECUREDESK-Mail** Encryption Service helps businesses meet legal, compliance and regulatory standards by automatically encrypting email messages based on company email policy. This policy based encryption service expands data loss prevention capabilities and improves the secure handling of confidential company data.

Customizable encryption policies allow automatic email encryption based on existing administration rules. Users can also encrypt communications on an as-needed basis. Messages are sent securely even if the recipient does not have encryption capabilities, eliminating the need for users to manage encryption keys.

How SECUREDESK-Mail (Encryption) works.

- Email messages tagged for encryption are delivered to the **SECUREDESK-Mail** Server datacenter via a secure SSL/TLS channel.
- Messages are scanned according to email filtering rules and the policies that define encryption then deliver the encrypted emails either directly to the recipients email inbox (if they have a Zix client installed) or store them centrally for access via a secure web portal and sends to the recipient an email requesting that they log onto the secure web portal. No hardware or software is required by sender or recipient.
- Once the recipient has logged onto the secure web portal, they can view the original message, reply to the sender and even create new messages securely.

SECUREDESK-Mail (Encryption) Service

Features	Benefits
Secure email communications between customers, clients, and partners	<ul style="list-style-type: none"> ➤ Easily encrypt confidential communications with important business partners and customers ➤ No additional hardware, software, or encryption keys required
